

Bugs Report

This screenshot shows a GitHub issue page for a repository named 'lebao05 / Testing_Homework6'. The issue is titled 'Bug: Forgot Password Is Case-Sensitive for Email Addresses #1' and is marked as 'Open'. The issue was opened 9m ago by the user 'lebao05'. The description states that the Forgot Password API treats uppercase and lowercase versions of the same email address as different accounts. The steps to reproduce involve registering a new account using 'test@gmail.com', sending a forgot password request using 'TEST@gmail.com', and observing the API response. The expected result is that the system should treat both email addresses as the same, but the actual result is that it treats them as different, preventing a password reset. The impact is that users cannot reset their password using different capitalizations of their email address. The right sidebar shows various settings for the issue, including assignees, labels, projects, milestones, relationships, development, notifications, and participants.

Description:

The Forgot Password API treats uppercase and lowercase versions of the same email address as different accounts. As a result, when a user registers with `test@gmail.com` and later requests a password reset using `TEST@gmail.com`, the system does not recognize the email as belonging to the same account. Consequently, no reset token is generated and the password-reset flow cannot proceed.

Steps to Reproduce:

Register a new account using `test@gmail.com`.
Send a Forgot Password request using `TEST@gmail.com`.
Observe the API response.
Check whether a reset token is generated.

Expected Result:

The system should treat `test@gmail.com` and `TEST@gmail.com` as the same email address and generate a reset token for the registered account.

Actual Result:

The system treats `TEST@gmail.com` as a different email address, so the Forgot Password request does not generate a reset token.

Impact:

Users may be unable to reset their password when they enter their registered email address using different capitalization.

Bug: Forgot Password Is Case-Sensitive for Email Addresses

This screenshot shows a GitHub issue page for the same repository. The issue is titled 'Bug: Non-Existing Product Can Be Added to Cart #2' and is marked as 'Open'. The issue was opened 9m ago by the user 'lebao05'. The description states that the system allows a user to add a product that does not exist in the product catalog to the cart. The steps to reproduce involve selecting a product ID that does not exist in the database, sending a request to add the product to the cart, and checking the cart contents. The expected result is that the system should reject the request and return an appropriate error, but the actual result is that the system successfully adds the non-existing product to the cart. The impact is that this can cause inconsistencies during cart calculation, checkout, or order creation. The right sidebar shows various settings for the issue, including assignees, labels, projects, milestones, relationships, development, notifications, and participants.

Description:

The system allows a user to add a product that does not exist in the product catalog to the cart. The API does not properly validate whether the specified product ID exists before adding the item.

Steps to Reproduce:

1. Select a product ID that does not exist in the database, e.g. 999999 .
2. Send a request to add the product to the cart.
3. Check the cart contents.

Expected Result:

The system should reject the request and return an appropriate error, such as `404 Not Found`, indicating that the product does not exist. The non-existing product should not be added to the cart.

Actual Result:

The system successfully adds the non-existing product to the cart.

Impact:

This can result in invalid cart data and may cause inconsistencies during cart calculation, checkout, or order creation.
